ALGORITHMS
Archaeological Site Exploration

Algorithm 1: Display Locations

1. Start.
2. Store the Hampi locations in an array.
3. Traverse the array from first to last location.
4. Display each location with its node number.
5. Stop.

Algorithm 2: Display Connections

1. Start.
2. Store the connections between locations using a graph.
3. Traverse each location in the graph.
4. Display all locations connected to it.
5. Stop.

Algorithm 3: Search Location

1. Start.
2. Read the location name to be searched.
3. Compare it with each stored location.
4. If a match is found, display “Location Found”.
5. If no match is found, display “Location Not Found”.
6. Stop.

Algorithm 4: Breadth First Search (BFS)

1. Start from the selected location.
2. Mark it as visited and insert it into a queue.
3. Remove one location from the queue and display it.
4. Add its unvisited connected locations to the queue.
5. Repeat until the queue becomes empty.
6. Stop.

Algorithm 5: Depth First Search (DFS)

1. Start from the selected location.
2. Mark the location as visited and display it.
3. Visit an unvisited connected location.
4. Continue visiting deeper connected locations.
5. Backtrack when no unvisited location remains.
6. Stop when all reachable locations are visited.
